Children Born in July and August: A study on the age regulation of primary school admission and student's education access and development

English Title: Children Born in July and August: A study on the age regulation of primary school admission and student's education access and development

Abstract: This paper discusses at the micro level the educational inequality resulted from the cut-off birthdate regulation in the current primary school admission system. According to our research, among the students who enroll in school, students born in July and August display relative disadvantage and adaptive difficulties in the construction of self-identity and study ability when compared with those born in September and October. Students born between November and June in the following year have medium performance. Moreover, this effect is accumulative. With regard to acquiring education resources, students born in July and August show the lowest possibility of getting into the key senior middle schools, which is 16.7%-22.8% lower than the rest of the student population, while their possibility to get into vocational school is the highest, 54.2%-60.8% higher than the others. This disadvantage is more prominent among the male students. Our study also show that the effect above is very strong and cannot be effectively suppressed by social economic factors. There is an insurmountable "July/August pitfall".
